There were a few pieces of feedback that I am taking into consideration for my integrate and configure model. I should look into the type of materials that would be good for this leopard web system. A change that could be made for all the models is to specify in detail the functionality for each type of user. Also, deciding on where in the process they will be combined and working together to make a robust system.

I made some recommendations for my peers. For Rene, I added that they should include a timeline. Also, a way to help users navigate the systems and using feedback. I recommended that they add more testing to make their systems more robust.

For the remainder of the semester, I have chosen to use the waterfall model. In my opinion, I thought I would have less trouble working with that type of process. It is complex but also simple in a way that each step will be completed first then continuing to the next step. This could help me with planning and preparation/organization for the next task. This model will make the documentation process more efficient to create. In conclusion, I believe I can utilize the waterfall model to be successful in my projects.
